

Swapped numbers

`swapnumbers: true` puts the number before the name, as `amsthm`'s `\swapnumbers` does.

1 Theorem (Fermat). *If p is prime, then $a^p \equiv a \pmod{p}$.*

2 Lemma. *$\binom{p}{k}$ is divisible by p for $0 < k < p$.*

1 Remark. In a swapped heading the number takes the heading's font, italic here, where after the name it would be upright.
